Statement

You are welcome to use the product of Xi'an NovaStar Tech Co., Ltd. (hereinafter referred to as NovaStar). This document is intended to help you understand and use the product. For accuracy and reliability, NovaStar may make improvements and/or changes to this document at any time and without notice. Any problem in use or any good suggestion, please contact us through ways provided in the document. We will do our utmost to solve the problems and adopt the suggestions after evaluation as soon as possible.

Change History

Version	Release Date	Description
V1.2.0	2018-08-10	Optimized the quick seam correction function.
V1.1.0	2018-07-10	<ul style="list-style-type: none">• Updated the loading capacity to 512×256 (PWM IC) pixels.• Added the following functions:<ul style="list-style-type: none">– HDR10.– Low latency (customized function).– LVDS transmission (customized function).
V1.0.2	2017-06-23	Optimized the document structure and content.
V1.0.1	2017-06-08	Optimized the data interface information.
V1.0.0	2016-12-05	The first version.

1 Safety

This chapter illustrates safety of the A8 receiving card to ensure the product's storage, transport, installation and use safety. Safety instructions are applicable to all personnel who contact or use the product. First of all, pay attention to following points.

- Read through the instructions.
- Retain all instructions.
- Comply with all instructions.

Storage and Transport Safety

- Pay attention to dust and water prevention.
- Avoid long-term direct sunlight.
- Do not place the product at a position near fire and heat.
- Do not place the product in an area containing explosive materials.
- Do not place the product in a strong electromagnetic environment.
- Place the product at a stable position to prevent damage or personal injury caused by dropping.
- Save the packing box and materials which will come in handy if you ever have to store and ship the product. For maximum protection during storage and shipping, repack the product as it was originally packed at the factory.

Installation and Use Safety

- Only trained professionals may install the product.
- Plugging and unplugging operations are prohibited when the power is on.
- Ensure safe grounding of the product.
- Always wear a wrist band and insulating gloves.
- Do not place the product in an area having frequent or strong shake.
- Perform dust removing regularly.
- Contact NovaStar for maintenance at any time, rather than have the product disassembled and maintained by non-professionals without authorization.
- Replace faulty parts only with the spare parts supplied by NovaStar.

2 Overview

A8 is a high-end receiving card developed by NovaStar, featuring small size and large loading capacity with a single card loading up to 512 x 256(PWM IC) pixels.

A8 can work with the independent controller MCTRL R5, making display rotate at any angle. A8 can also work with the independent controller MCTRL4K featuring large loading capacity and support HDR10 compliant video input, realizing larger dynamic brightness range and larger color space, and making the image smoother.

A8 supports pixel level brightness and chroma calibration by working with NovaLCT and NovaCLB to realize calibration on each pixel. It can effectively remove color difference and greatly improve LED display image consistency, presenting smoother images to users. In addition, it also supports image rotation in 90° increments, creating richer images and improving visual experiences.

Software and hardware designs of the A8 concern the user deployment as well as operating and maintenance scenarios, enabling easier deployment, more stable operating and more efficient maintenance.

Advanced hardware design:

- The small-size hardware design is applicable to scenarios of small cabinet space and small pixel pitch.
- The used DDR3 connectors have stable contact performance and good compatibility.

Useful software design:

- Support for HDR10.
- Support for low latency (Supported by dedicated firmware program).
- Support for 18Bit+.
- Support for ClearView.
- Support for LVDS transmission (Supported by dedicated firmware program).
- Support for smart module (Supported by dedicated firmware program).
- Support for quick seam correction.
- Support for 3D function.
- Support for auto module calibration.
- Support for Mapping function.
- Support for pre-stored image setting of the receiving card.

- Support for module Flash management.
- Supports monitoring voltage and temperature of itself without using other peripherals.
- Support for monitoring of Ethernet cable communication status (Supported by dedicated firmware program).
- Support for 5-pin LCD module.
- Support for image rotation in 90° increments.

3 Features

3.1 Improvement in Display Effect

Features	Description
Supporting HDR10	A8 can work with the independent controller MCTRL4K featuring large loading capacity to support HDR10 compliant video input, realizing larger dynamic brightness range and larger color space, making the image smoother.
Supporting low latency (Customized function)	A8 can reduce the frame latency (for the module that the RAM is built within the driver IC) of the video source on the receiving card end to 1 frame.
Supporting 18Bit+ grayscale output	Enabling of 18 bit mode could improve LED display grayscale by 4 times, and therefore avoid grayscale loss caused by brightness reduction and make images finer.
Supporting ClearView	Enable ClearView on NovaLCT to adjust the texture, size and contrast in different area based on human visual system to make image more realistic.
Supporting arbitrary-angle rotation for the screen	Make A8 work together with MCTRL R5 and then set the screen on SmartLCT to make display rotate at any angel, show different shapes, and present changeable images.
Supporting pixel level brightness and chroma calibration	Working with NovaLCT and NovaCLB, A8 supports brightness and chroma calibration on each pixel.
Supporting image rotation in 90° increments (Calibration not supported after rotation)	On NovaLCT, the image on the screen can be set to rotate in the multiples of 90° (90°, 180°, 270° and 360°).
Supporting quick seam correction	Working with NovaLCT, A8 supports quick adjustment of bright and dark lines, which can remove the seams between modules and between cabinets.

Features	Description
Supporting 3D function	On NovaLCT or operation panel of controllers which support 3D function, you can enable 3D function and set the 3D parameters to make the LED screen display 3D effects.

3.2 Improvement in Maintainability

Features	Description
Supporting the smart module (Supported by dedicated firmware program)	The smart module is composed of Flash and MCU. Flash could store calibration coefficients and module information. MCU could communicate with the receiving card to realize monitoring over temperature, voltage and wiring communication status for the module. Working with the driver chip, A8 supports open circuit detection on LED. The smart module could make monitoring unit smaller, requiring no independent monitoring card and saving cabinet space.
Supporting LVDS transmission (Supported by dedicated firmware program)	The transmission mode of low-voltage differential signaling (LVDS) is used, which reduces the number of data cables that connect the receiving card's HUB board to the module, increases the transmission distance, improves the signal transmission quality, and better stabilizes the image output.
Supporting auto module calibration	After the module has been replaced, the receiving card can automatically read the new module ID and calibration coefficient which could be saved to calibration system files.
Supporting Mapping function	Enable the Mapping function on NovaLCT, then the target cabinet will display the cabinet number and Ethernet port information, and the user could get the receiving card's location and wiring route.
Supporting setting of images pre-stored of the receiving card	On NovaLCT, the specified images could be set as the screen startup image and images used when the Ethernet cable is disconnected or no video source signal is available.
Supporting module Flash management	On NovaLCT, lamp panel Flash could be managed.
Supporting monitoring voltage and temperature of itself	The voltage and temperature of the receiving card itself can be monitored without using other peripherals. The monitoring data can be checked on NovaLCT.
Supporting LCD module	Supports NovaStar's general 5-pin LCD module.

Features	Description
	The LCD module is connected to the HUB board to display temperature, voltage, single operating time and total operating time of the receiving card.
Support one-click application of calibration coefficient in module Flash	In the event of network outage, hold down the self-test button to read the calibration coefficient in module Flash back to the receiving card.

3.3 Improvement in Hardware Reliability

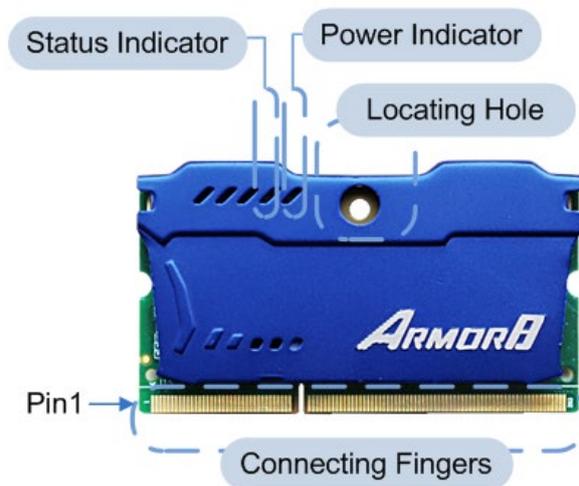

Features	Description
Supporting dual-card backup	In the high-reliability environment, single HUB board could be populated with two A8 receiving cards. In case that the main receiving card fails, the standby one will serve in a timely manner to ensure normal operation of the display.
Supporting dual-power backup detection	Two power supplies could be simultaneously connected, and operating status of the power supplies could be detected.
Supporting loop backup	HUB's Ethernet port improves the reliability for the serial connection of the receiving card through main and standby redundant mechanism. Among the main and standby serial connection lines, if one fails, the other will begin to work to ensure the normal operation of the display.

3.4 Improvement in Software Reliability

Features	Description
Supporting readback of firmware version	On NovaLCT, the firmware versions of the receiving card can be read back.
Supporting dual-backup and restoring of the calibration coefficient	Calibration coefficients could be saved to both the factory area and application area at the same time. Calibration coefficients in the factory area is default as the delivery value, while the calibration coefficient in the application area could be modified or be restored to the factory reset by the user on NovaLCT.
Supporting readback of configuration file	<ul style="list-style-type: none"> On NovaLCT, the receiving card configuration parameters can be backed up to the receiving card. On NovaLCT, the receiving card configuration parameters can be read back.

4 Hardware

4.1 Appearance

Product images provided in this file are for reference only, and the actual products shall prevail.

Models of DDR3 connectors (connecting fingers) and receptacle used by A8 are shown in table Table 4-1.

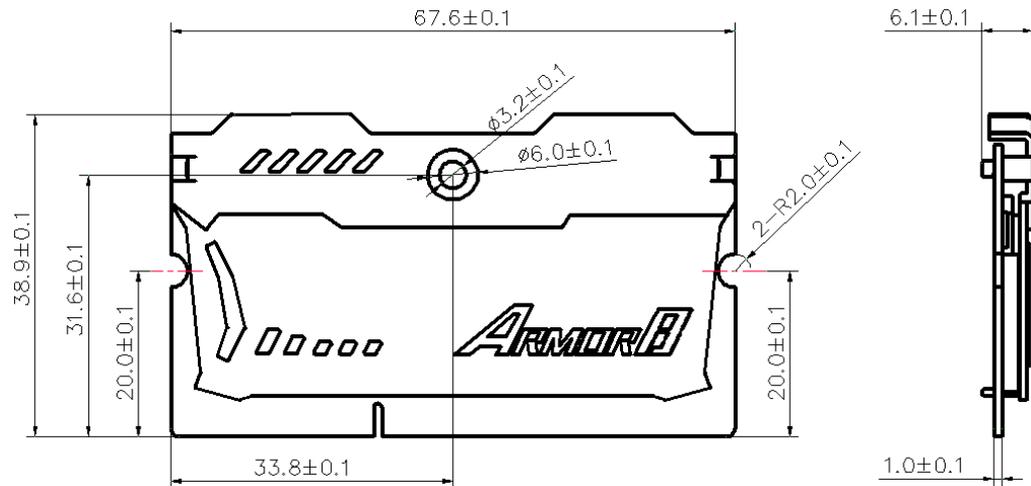

Table 4-1 Model of high-density connector

Type	Brand	Material Code
DDR3	/	/
Receptacle	Tyco	2-2013289-1

4.2 Dimensions

Board thickness is not greater than 1.5 mm, and the total thickness (board thickness + thickness of both front panel and back panel) is not greater than 6.5 mm.

Unit of the dimension chart is “mm”. Ground connection is enabled for location hole (GND).

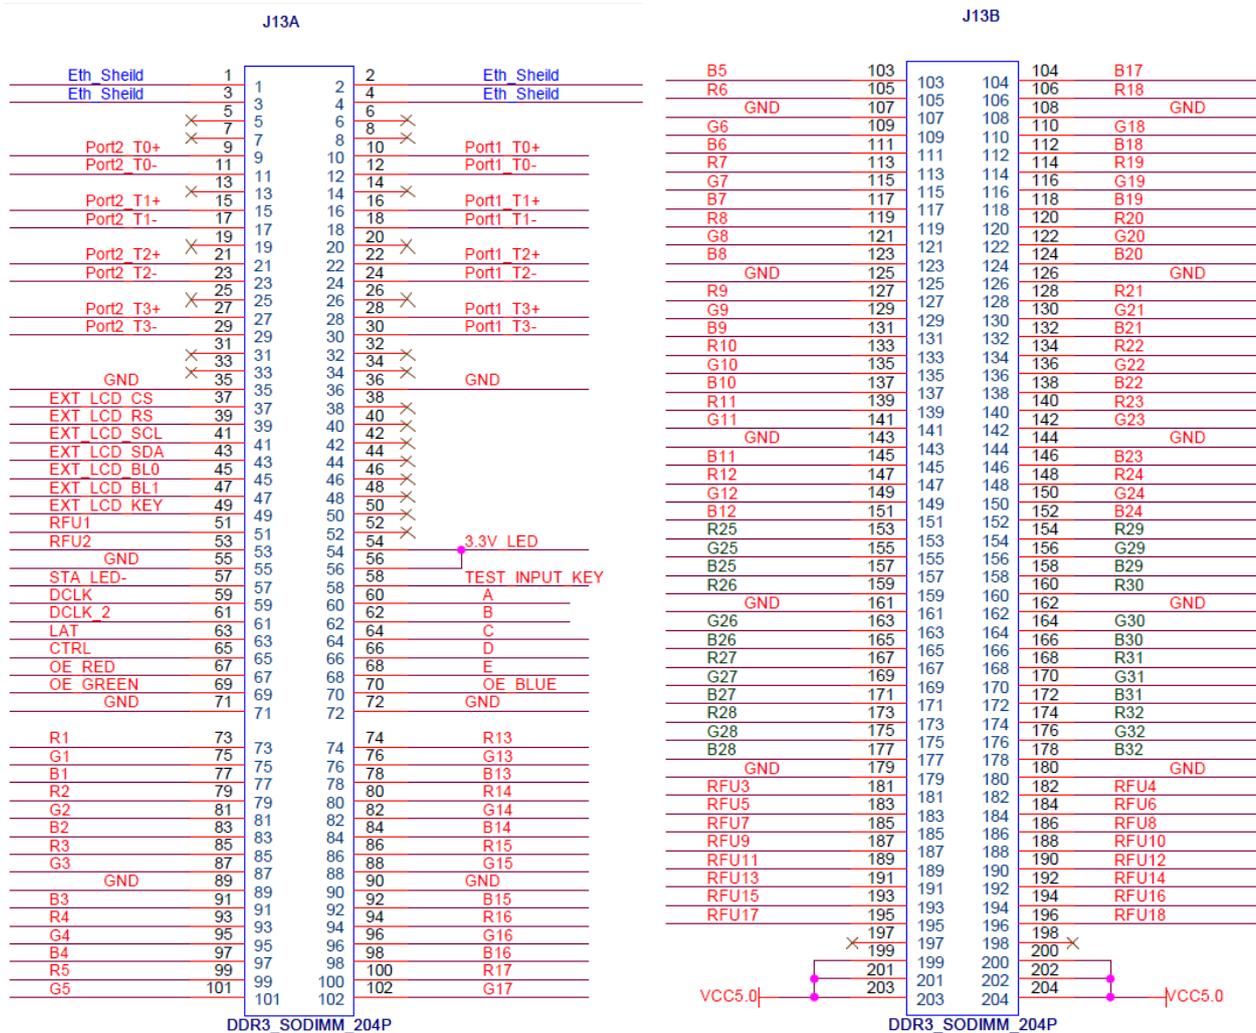

4.3 Indicators

Indicator	Status	Description
Status indicator (green)	Flashing every other 1s.	The receiving card works normally, Ethernet cable connection is normal, and video source input is available.
	Flashing every other 3s.	The receiving card works normally, while the Ethernet cable connection is abnormal.
	Rapidly flashing for 3 times every other 3s.	The receiving card works normally, Ethernet cable connection is normal, while no video source input is available.
	Rapidly flashing every other 0.5s.	Program loading fails in normal operating state, coming to the backup operating state.
	Rapidly flashing for 8 times every other 1s.	The receiving card is in the Ethernet port backup status and the backup is effective.
Power indicator (red)	Always on	It is always on after the power is on.

5 Firmware Update

- Step 1 Visit www.novastar.tech to download the firmware update package and save it to PC.
- Step 2 Run NovaLCT and choose **User > Advanced Synchronous System User Login** to log in.
- Step 3 Type the secret code "**admin**" to enter the program loading page.
- Step 4 Click **Browse** to select the program (the firmware update package you saved on PC) path and then click **Update**.
- Step 5 Click **Refresh** to check current hardware version information.

6 Applications

A8 is applied to LED display synchronous system which is generally composed of the LED display, HUB board, receiving card, video controller and controller peripheral. The receiving card is connected to the display over a HUB board.

Synchronous system requires connecting a computer to display the computer's images and texts on the LED screen. Structure of the synchronous system is as shown in the following figure.

7 Specifications

Input voltage	DC 3.3 V–5.5 V
Rated current	0.5 A
Rated power consumption	2.5 W
Operating temperature	-20°C–70°C
Storage temperature	-25°C–125°C
Operating humidity	10%RH–90%RH
Dimensions	67.6 mm × 38.9 mm × 6.1 mm
Net weight	9.9 g
Certifications	RoHS
Packing	An antistatic bag and anti-collision foam are prepared for each receiving card. Dimensions of the packing box: 378 mm × 190 mm × 120 mm, each of 40 receiving cards.

B Terms

18Bit+

Specify the grayscale of LED displays. Enabling 18 bit mode on NovaLCT-Mars could improve LED display grayscale by 4 times, and therefore avoid grayscale loss caused by brightness reduction and make images finer.

ClearView

Display screen effects. Enable ClearView on NovaLCT-Mars to adjust the texture, size and contrast in different area based on human visual system to make image more realistic.

Calibration coefficient

Calibration system generates a group of values for each LED lamp, including information about brightness and chroma. After display calibration, the calibration values of each lamp are just the calibration coefficient.

Smart module

The smart module is composed of Flash and MCU.

Flash could store calibration coefficients and lamp panel information. MCU could communicate with the receiving card to realize monitoring over temperature, voltage and wiring communication status, Working with the driver chip, A8 supports open circuit detection on LED.

The smart module could make monitoring unit smaller, requiring no independent monitoring card and saving cabinet space.

Mapping

After the Mapping function is enabled on NovaLCT, the target cabinet will display the cabinet number and Ethernet port information, and the user could get the receiving card's location and wiring route.
